  - Informational

## Protocol Summary

PasswordStore is a protocol dedicated to storage and retrieval of a user's passwords. The protocol is designed to be used by a single user, and is not designed to be used by multiple users. Only the owner should be able to set and access this password.

## Disclaimer

The YOUR\_NAME\_HERE team makes all effort to find as many vulnerabilities in the code in the given time period, but holds no responsibilities for the findings provided in this document. A security audit by the team is not an endorsement of the underlying business or product. The audit was time-boxed and the review of the code was solely on the security aspects of the Solidity implementation of the contracts.

## Risk Classification

		Impact		
		High	Medium	Low
Likelihood	High	H	H/M	M
	Medium	H/M	M	M/L
	Low	M	M/L	L

We use the CodeHawks severity matrix to determine severity. See the documentation for more details.

## Audit Details

**The findings described in this document correspond the following commit hash:**

```
1 2e8f81e263b3a9d18fab4fb5c46805ffc10a9990
```

## Scope

```
1 ./src/  
2 #-- PasswordStore.sol
```

## Roles

- Owner: The user who can set the password and read the password.
- Outsiders: No one else should be able to set or read the password.

## Executive Summary

### Issues found

Severity	Number of issues found
High	2
Medium	0
Low	0
Info	1
Total	3

## Findings

### High

#### [H-1] Storing the password on-chain makes it visible to anyone, and no longer private

**Description:** All data stored on-chain is visible to anyone, and can be read directly from the blockchain. The `PasswordStore : : s_password` variable is intended to be a private variable and only accessed through the `PasswordStore : : getPassword` function, which is intended to be only called by the owner of the contract.

We show one such method of reading any data off chain below.

**Impact:** Anyone can read the private password, severely breaking the functionality of the protocol.

```
3     s_password = newPassword;  
4     emit SetNetPassword();  
5 }
```

**Impact:** Anyone can set/change the password of the contract, severely breaking the contract intended functionality.

**Proof of Concept:** Add the following to the `PasswordStore.t.sol` test file.

Code

```
1     function test_anyone_can_set_password(address randomAddress) public  
2     {  
3         vm.assume(randomAddress != owner);  
4         vm.prank(randomAddress);  
5         string memory expectedPassword = "myNewPassword";  
6         passwordStore.setPassword(expectedPassword);  
7  
8         vm.prank(owner);  
9         string memory actualPassword = passwordStore.getPassword();  
10        assertEq(actualPassword, expectedPassword);  
11    }
```

**Recommended Mitigation:** Add an access control conditional to the `setPassword` function.

```
1     if(msg.sender != s_owner){  
2         revert PasswordStore__NotOwner();  
3     }
```

## Informational
